

I think we should build this.

A pitch, from me to you, about something I built quietly for 120/Life — and why I don't think it should stay ours alone.

Running a ten-person company, I was the only person who knew everything happening at once — which suppliers owed us what, which decisions were quietly stuck behind me, which numbers meant something and which just looked scary that week. Every founder hits this wall eventually. You stop being able to hold the whole business in your head, and there's no one whose job it is to notice what falls through.

So I built something that reads what's actually happening — email, Slack, calls, the books, the storefront — and tells me every morning exactly what needs me, in what order. Not a task list. Not another inbox. Something that remembers.

WHAT IT CAUGHT, WEEK ONE

WHAT I ALMOST BELIEVED

WHAT WAS ACTUALLY TRUE

→

+\$34K

The loss I almost acted on, versus the profit it turned out to be the moment the books actually closed. Ad spend was never up 61% — it was up 23%. Same report. Nearly the opposite story.

A promise from a partner — “I’ll look into it and follow up” — that had quietly evaporated, the way those always do, because nobody ever attaches a date to hold themselves to.

A SKU duplicated across two of my own product listings, silently splitting our sales data every day. I’d never once noticed it myself.

None of that is a dashboard. A dashboard tells you what happened. This tells me what to actually do about it, this morning, in order — and it never once sends anything on my behalf. It drafts. I decide. That part matters more than anything else about it.

“Nobody’s job is to notice. That’s the whole gap.”

I don't think this is unique to me. Every founder past the "I can hold it all in my head" stage — north of ten people, nowhere near a real ops department — has this exact hole. Not disorganization. Just nobody whose job it is to notice. The tools they already own don't fix it: trackers assume someone updates them, chatbots only answer what you think to ask, and automation just makes more happen faster — the opposite of what you need when attention is what's short.

I think there's a real business in building this for other founders the way I built it for myself — not a subscription, a real engagement: learn how a company actually works, wire it into what they already use, run it until it earns trust, then hand it over. The hard part was never the idea. It was finding every quiet way a system like this loses your trust before it earns anything. That part is done, and it works.

I want to build this with you — not as a side project. Let's find time this week and bring it to two or three founders we know.
